Knapsack 1

Problem Statement

There are N items, numbered $1, 2, \ldots, N$. For each i ($1 \leq i \leq N$), Item i has a weight of w_i and a value of v_i.

Taro has decided to choose some of the N items and carry them home in a knapsack. The capacity of the knapsack is W, which means that the sum of the weights of items taken must be at most W.

Find the maximum possible sum of the values of items that Taro takes home.

Constraints

- All values in input are integers.
- $1 \leq N \leq 100$
- $1 \leq W \leq 10^5$
- $1 \leq w_i \leq W$
- $1 \leq v_i \leq 10^9$

Input

Input is given from Standard Input in the following format:

$$
\begin{array}{ll}
N & W \\
w_1 & v_1 \\
w_2 & v_2 \\
: & \\
w_N & v_N
\end{array}
$$

Output

Print the maximum possible sum of the values of items that Taro takes home.

Sample Input 1 Copy

Copy

```
3 8
3 30
4 50
5 60
```

Sample Output 1 Copy

Copy

```
90
```

Items 1 and 3 should be taken. Then, the sum of the weights is $3 + 5 = 8$, and the sum of the values is $30 + 60 = 90$.

Sample Input 2 Copy

```
5 5
1 1000000000
1 1000000000
1 1000000000
1 1000000000
1 1000000000
```

Sample Output 2 Copy

```
5000000000
```

The answer may not fit into a 32-bit integer type.

Sample Input 3 Copy

```
6 15
6 5
5 6
6 4
6 6
3 5
7 2
```

Sample Output 3 Copy

```
17
```

Items 2, 4 and 5 should be taken. Then, the sum of the weights is $5 + 6 + 3 = 14$, and the sum of the values is $6 + 6 + 5 = 17$.
